Notes:
1. Other operations except for indicated this column are prohibited.
2. Do not apply for a following state two or more on the same time;
   1) $\overline{CE}$f_1 = V_{IL}, 2)$\overline{CE}$f_2 = V_{IL}, 3) $\overline{CE}$1r = V_{IL} and CE2r = V_{IH}
3. FCRAM Output Disable condition should not be kept longer than 1µs.
4. $\overline{WE}$ can be V_{IL} if $\overline{OE}$ is V_{IL}, $\overline{OE}$ at V_{IH} initiates the write operations.
5. FCRAM $\overline{LB}$, $\overline{UB}$ control at Read operation is not supported.
6. It is also used for the extended sector group protections.
7. The FCRAM Power Down Program can be performed one time after compliance of Power-UP timings and it should not be re-programmed after regular Read or Write.
8. FCRAM Power Down mode can be entered from Standby state and all DQ pins are in High-Z state. I_{PD}r current and data retention depends on the selection of Power Down Program.
9. Either or both $\overline{LB}$ and $\overline{UB}$ must be Low for FCRAM Read Operation.
10. Can be either V_{IL} or V_{IH} but must be valid before Read or Write.
11. Please refer to " FCRAM Power Down Program Key Table " in next page.
12. Protect " outer most " 2x8K bytes (4 words) on both ends of the boot block sectors.

Note : When multiple sector erase over several banks is operated, the system cannot read out of the bank to which a sector being erased belongs. For example, suppose that erasing is taking place at both Bank A and Bank B, neither Bank A nor Bank B is read out (they would output the sequence flag once they were selected.) Meanwhile the system would get to read from either Bank C or Bank D.

* : By writing erase suspend command on the bank address of sector being erased, the erase operation gets suspended so that it enables reading from or programming the remaining sectors.

Note: Bank 1 and Bank 2 are divided for the sake of convenience at Simultaneous Operation. Actually, the Bank consists of 4 banks, Bank A, Bank B, BankC and Bank D. Bank Address (BA) meant to specify each of the Banks.

Sector Group Protection	Sector Group Addresses	L	L	L	H	L	01h*1

Legend: L = V_{IL}, H = V_{IH}. See DC Characteristics for voltage levels.

*1 : Outputs 01h at protected sector group addresses and outputs 00h at unprotected sector group addresses.

*2 : A read cycle at address (BA) 01h outputs device code. When 227Eh was output, this indicates that there will require two additional codes, called Extended Device Codes. Therefore the system may continue reading out these Extended Device Codes at the address of (BA) 0Eh, as well as at (BA) 0Fh.

8. The system should generate the following address patterns: 555h or 2AAh to addresses A_{10} to A_0

9. Both Read/Reset commands are functionally equivalent, resetting the device to the read mode.

10. The command combinations not described in this table are illegal.

$\overline{OE}$ High Pulse Width	t_{OP}	25	1000	ns	*6,*9,*10
	$t_{OP(ABS)}$	12	—	ns	*7

Notes *1: The output load is 30pF.

*2: The output load is 5pF.

*3: The t_{CE} is applicable if $\overline{OE}$ is brought to Low before $\overline{CE}$1r goes Low and is also applicable if actual value of both or either t_{ASO} or t_{CLOL} is shorter than specified value.

*4: Applicable only to A0 and A1 when both $\overline{CE}$1r and $\overline{OE}$ are kept at Low for the address access.

*5: Applicable if $\overline{OE}$ is brought to Low before $\overline{CE}$1r goes Low.

*6: The t_{ASO}, t_{CLOL}(min) and t_{OP}(min) are reference values when the access time is determined by t_{OE}. If actual value of each parameter is shorter than specified minimum value, t_{OE} become longer by the amount of subtracting actual value from specified minimum value. For example, if actual t_{ASO}, t_{ASO}(actual), is shorter than specified minimum value, t_{ASO}(min), during $\overline{OE}$ control access (ie., $\overline{CE}$1r stays Low), the t_{OE} become t_{OE}(max) + t_{ASO}(min) – t_{ASO}(actual).

*7: The $t_{ASO(ABS)}$ and $t_{OP(ABS)}$ is the absolute minimum value during $\overline{OE}$ control access.

*8: The t_{AX} is applicable when both A0 and A1 are switched from previous state.

*9: If actual value of either t_{CLOL} or t_{OP} is shorter than specified minimum value, both t_{OLAH} and t_{OLCH} become t_{RC}(min) – t_{CLOL}(actual) or t_{RC}(min) – t_{OP}(actual).

*10: Maximum value is applicable if $\overline{CE}$1r is kept at Low.

$\overline{WE}$ Write Recovery Time	t_{WR}	10	1000	ns	*1, *3, *9
Data Setup Time	t_{DS}	15	—	ns	
Data Hold Time	t_{DH}	0	—	ns	
$\overline{CE}$1r High Pulse Width	t_{CP}	12	—	ns	*9

Notes: *1: Minimum value must be equal or greater then the sum of actual t_{CW} (or t_{WP}) and t_{WRC} (or t_{WR}).

*2: New write address is valid from either $\overline{CE}$1r or $\overline{WE}$ is bought to High.

*3: The t_{OEH} is specified from end of t_{WC}(min). The t_{OEH}(min) is a reference value when the access time is determined by t_{OE}.

If actual value, t_{OEH}(actual) is shorter than specified minimum value, t_{OE} become longer by the amount of subtracting actual value from specified minimum value.

*4: The t_{OEH}(max) is applicable if $\overline{CE}$1r is kept at Low and both $\overline{WE}$ and $\overline{OE}$ are kept at High.

*5: The $t_{OEH(ABS)}$ is the absolute minimum value if write cycle is termnated by $\overline{WE}$ and $\overline{CE}$1r stays Low.

*6: t_{OHCL}(min) must be satisfied if read operation is not performed prior to write operation.
In case $\overline{OE}$ is disabled after t_{OHCL}(min), $\overline{WE}$ Low must be asserted after t_{RC}(min) from $\overline{CE}$1r Low.
In other words, read operation is initiated if t_{OHCL} (min) is not satisfied.

*7: Applicable if $\overline{CE}$1r stays Low after read operation.

*8: t_{CW} and t_{WP} is applicable if write operation is initiated by $\overline{CE}$1r and $\overline{WE}$, respectively.

*9: t_{WRC} and t_{WR} is applicable if write operation is terminated by $\overline{CE}$1r and $\overline{WE}$, respectively.
The t_{WR}(min) can be ignored if $\overline{CE}$1r is brought to High together or after $\overline{WE}$ is brought to High.
In such case, the t_{CP}(min) must be satisfied.

■ PIN CAPACITANCE

Parameter	Symbol	Condition	Value			Unit
			Min.	Typ.	Max.	
Input Capacitance	C_{IN}	V_{IN} = 0	—	—	20.0	pF
Output Capacitance	C_{OUT}	V_{OUT} = 0	—	—	25.0	pF
Control Pin Capacitance	C_{IN2}	V_{IN} = 0	—	—	25.0	pF

Note: Test conditions Ta = 25°C, f = 1.0 MHz

■ HANDLING OF PACKAGE

Please handle this package carefully since the sides of package create acute angles.

■ CAUTION

- The high voltage (V_{ID}) cannot apply to address pins and control pins except $\overline{\text{RESET}}$. Exception is when autoselect and sector group protect function are used, then the high voltage (V_{ID}) can be applied to $\overline{\text{RESET}}$.
- Without the high voltage (V_{ID}) , sector group protection can be achieved by using “Extended Sector Group Protection” command.
