

## ASSP

# Dual Serial Input PLL Frequency Synthesizer

## MB15F04

### ■ DESCRIPTION

The Fujitsu MB15F04 is a serial input Phase Locked Loop (PLL) frequency synthesizer with two 2.0GHz prescalers. A 64/65 or a 128/129 for both 2.0GHz prescalers can be selected that enables pulse swallow operation.

The latest BiCMOS process technology is used, resultantly a supply current is limited as low as 11.0mA typ. at a supply voltage of 3.0V.

Furthermore, a super charger circuit is included to provide a fast tuning as well as low noise performance. As a result of this, MB15F04 is ideally suitable for digital mobile communications.

### ■ FEATURES

- High frequency operation      RX synthesizer : 2.0 GHz max.  
   TX synthesizer : 2.0 GHz max.
- Low power supply voltage:  $V_{CC} = 2.7$  to  $3.6$  V
- Very Low power supply current :  $I_{CC} = 11.0$  mA typ. ( $V_{CC} = 3V$ )
- Power saving function :  $I_{PSTX} = I_{PSTX} = 10$   $\mu$ A max.
- Serial input 14-bit programmable reference divider:  $R = 5$  to  $16,383$
- Serial input 18-bit programmable divider consisting of:
  - Binary 7-bit swallow counter: 0 to 127
  - Binary 11-bit programmable counter: 5 to 2,047
- On-chip high performance charge pump circuit and phase comparator, achieving high-speed lock-up and low phase noise
- Wide operating temperature:  $T_a = -40$  to  $85^{\circ}\text{C}$

### ■ PACKAGE

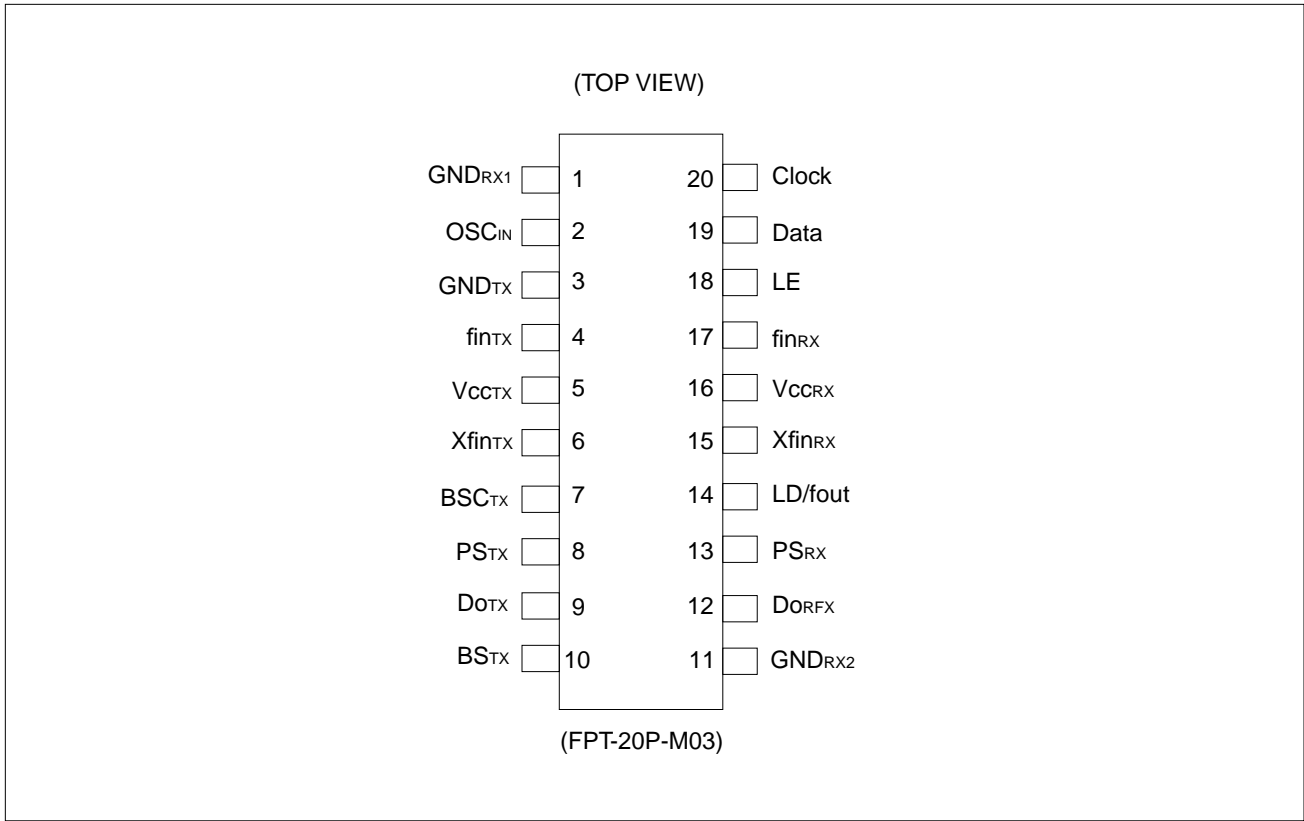

20-pin, Plastic SSOP

(FPT-20P-M03)

# MB15F04

## PIN ASSIGNMENT

## ■ PIN DESCRIPTIONS

Pin No.	Pin name	I/O	Descriptions
1	GND <sub>RX1</sub>	—	Ground for RX-PLL section.
2	OSC <sub>in</sub>	I	The programmable reference divider input. TCXO should be connected with a AC coupling capacitor.
3	GND <sub>TX</sub>	—	Ground for the TX-PLL section.
4	fin <sub>TX</sub>	I	Prescaler input pin for the TX-PLL. The connection with VCO should be AC coupling.
5	Vcc <sub>TX</sub>	—	Power supply voltage input pin for the TX-PLL section. When power is OFF, latched data of TX-PLL is cancelled.
6	Xfin <sub>TX</sub>	I	Prescaler complimentary input for the TX-PLL section. This pin should be grounded via a capacitor.
7	BSC <sub>TX</sub>	I	Analog switch output (BS <sub>TX</sub> ) control for the TX section. Always pull-down the BSC <sub>TX</sub> pin when not using BS <sub>TX</sub> . (Do not leave open.) BSC <sub>TX</sub> = "H"; outputs the Do <sub>TX</sub> state. BSC <sub>TX</sub> = "L"; goes to high impedance.
8	PS <sub>TX</sub>	I	Power saving mode control for the TX-PLL section. This pin must be set at "L" Power-ON. (Open is prohibited.) PS <sub>TX</sub> = "H"; Normal mode PS <sub>TX</sub> = "L"; Power saving mode
9	Do <sub>TX</sub>	O	Charge pump output for the TX-PLL section. Phase characteristics of the phase detector can be reversed by FC-bit.
10	BS <sub>TX</sub>	O	Analog switch output for the TX selection.
11	GND <sub>RX2</sub>	—	Ground 2 for the RX section.
12	Do <sub>RX</sub>	O	Charge pump output for the RX-PLL section. Phase characteristics of the phase detector can be reversed by FC-bit.
13	PS <sub>RX</sub>	I	Power saving mode control for the RX-PLL section. This pin must be set at "L" Power-ON. (Open is prohibited.) PS <sub>RX</sub> = "H"; Normal mode PS <sub>RX</sub> = "L"; Power saving mode
14	LD/fout	O	Lock detect signal output (LD) / phase comparator monitoring output (fout) The output signal is selected by a LDS bit in a serial data. LDS bit = "H"; outputs fout signal LDS bit = "L"; outputs LD signal
15	Xfin <sub>RX</sub>	I	Prescaler complimentary input for the RX-PLL section. This pin should be grounded via a capacitor.
16	Vcc <sub>RX</sub>	—	Power supply voltage input pin for the RX-PLL section. When power is OFF, latched data of RX-PLL is cancelled.
17	fin <sub>RX</sub>	I	Prescaler input pin for the RX-PLL. The connection with VCO should be AC coupling.
18	LE	I	Load enable signal input (with the schmitt trigger circuit.) When LE is "H", data in the shift register is transferred to the corresponding latch according to the control bit in a serial data.
19	Data	I	Serial data input (with the schmitt trigger circuit.) A data is transferred to the corresponding latch (TX-ref counter, TX-Prog. counter, RX-ref. counter, RX-prog. counter) according to the control bit in a serial data.
20	Clock	I	Clock input for the 23-bit shift register (with the schmitt trigger circuit.) One bit data is shifted into the shift register on a rising edge of the clock.

## ■ BLOCK DIAGRAM

## ■ ABSOLUTE MAXIMUM RATINGS (See WARNING)

Parameter	Symbol	Rating	Unit	Remark
Power supply voltage	$V_{CC}$	−0.5 to +4.0	V	
Input voltage	$V_i$	−0.5 to $V_{CC} + 0.5$	V	
Output voltage	$V_o$	−0.5 to $V_{CC} + 0.5$	V	
Output current	$I_o$	−10 to +10	mA	
Storage temperature	$T_{STG}$	−55 to +125	°C	

**WARNING:** Permanent device damage may occur if the above **Absolute Maximum Ratings** are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ■ RECOMMENDED OPERATING CONDITIONS

Parameter	Symbol	Value			Unit	Note
		Min	Typ	Max		
Power supply voltage	$V_{CC}$	2.7	3.0	3.6	V	$V_{CCTX} = V_{CCR\bar{X}}$
Input voltage	$V_i$	GND	–	$V_{CC}$	V	
Operating temperature	$T_a$	−40	–	+85	°C	

### Handling Precautions

- This device should be transported and stored in anti-static containers.
- This is a static-sensitive device; take proper anti-ESD precautions. Ensure that personnel and equipment are properly grounded. Cover workbenches with grounded conductive mats.
- Always turn the power supply off before inserting or removing the device from its socket.
- Protect leads with a conductive sheet when handling or transporting PC boards with devices.

## ELECTRICAL CHARACTERISTICS

Analog switch on resistance	BS <sub>TX</sub>	R <sub>ON</sub>	—	—	50	—	Ω

\*1: Conditions ; fin<sub>TX/RX</sub> = 2000 MHz, f<sub>OSC</sub> = 12 MHz, V<sub>CCTX/RF</sub> = 3.0 V, Ta = +25°C, in locking state.

\*2: Conditions ; V<sub>CCTX/RX</sub> = 3.0 V, f<sub>OSC</sub> = 12.8 MHz, Ta = +25°C

\*3: AC coupling. The minimum operating frequency is specified with a coupling capacitor 1000 pF connected.

\*4: The symbol "—" (minus) means direction of current flow.

## ■ FUNCTIONAL DESCRIPTIONS

The divide ratio can be calculated using the following equation:

$$f_{VCO} = \{(P \times N) + A\} \times f_{osc} \div R \quad (A < N)$$

- $f_{VCO}$ : Output frequency of external voltage controlled oscillator (VCO)  
 P: Preset divide ratio of dual modulus prescaler (64 or 128)  
 N: Preset divide ratio of binary 11-bit programmable counter (5 to 2,047)  
 A: Preset divide ratio of binary 7-bit swallow counter ( $0 \leq A \leq 127$ )  
 $f_{osc}$ : Reference oscillation frequency  
 R: Preset divide ratio of binary 14-bit programmable reference counter (5 to 16,383)

## Serial Data Input

Serial data is entered using three pins, Data pin, Clock pin, and LE pin. Programmable dividers of TX/RX-PLL sections, programmable reference dividers of TX/RX PLL sections are controlled individually.

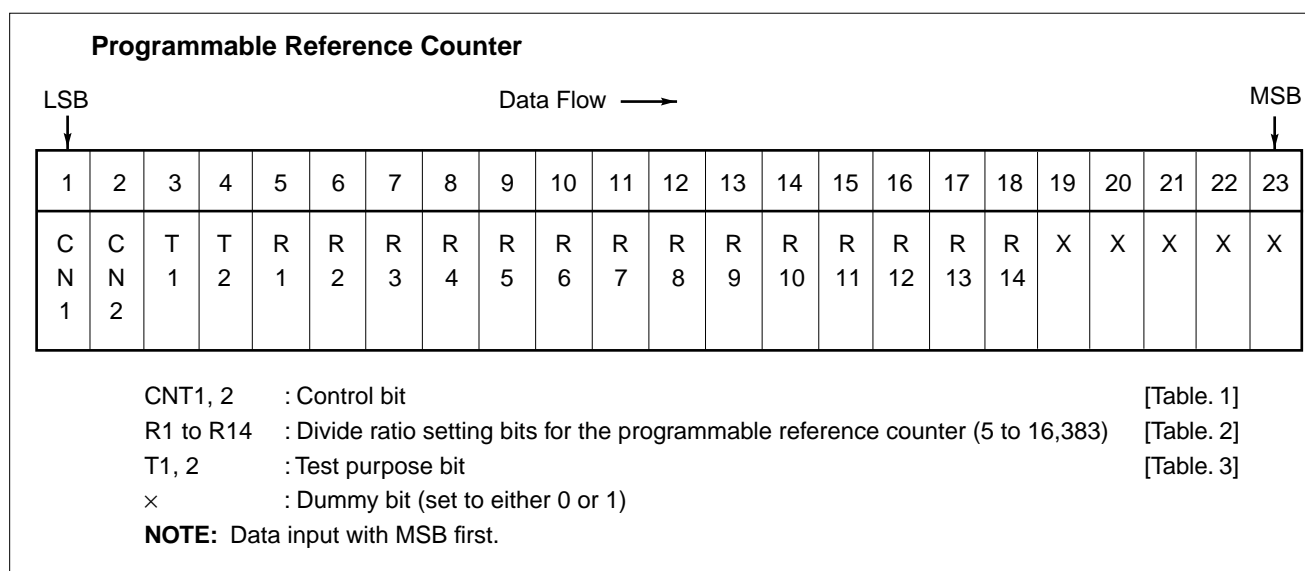

Serial data of binary data is entered through Data pin.

On rising edge of clock, one bit of serial data is transferred into the shift register. When load enable signal is high, the data stored in the shift register is transferred to one of latch of them depending upon the control bit data setting.

**Table1. Control Bit**

Control bit		Destination of serial data
CN1	CN2	
L	L	The programmable reference counter for the TX-PLL.
H	L	The programmable reference counter for the RX-PLL.
L	H	The programmable counter and the swallow counter for the TX-PLL
H	H	The programmable counter and the swallow counter for the RX-PLL

## Shift Register Configuration

## Programmable Counter

Data Flow →																						
LSB ↓																						MSB ↓
1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

127	1	1	1	1	1	1	1

Note: Divide ratio (A) range = 0 to 127

**Table. 6 Prescaler Data Setting**

		SW = "H"	SW = "L"
Prescaler divide ratio	TX-PLL	64/65	128/129
	RX-PLL	64/65	128/129

**Table. 7 Phase Comparator Phase Switching Data Setting**

	FC = H	FC = L
$f_r > f_p$	H	L
$f_r = f_p$	Z	Z
$f_r < f_p$	L	H
VCO polarity	(1)	(2)

Note:

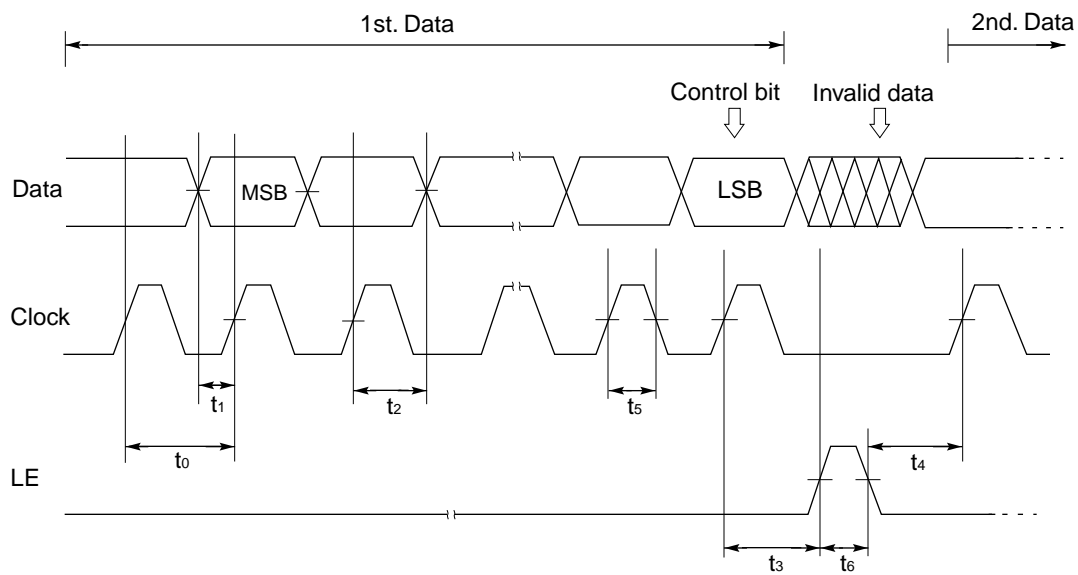

- Z = High-impedance
- Depending upon the VCO and LPF polarity, FC bit should be set.

**Table. 8 LD/fout Output Select Data Setting**

LDS	LD/fout output signal
H	fout ( $f_{rTX/RX}$ , $f_{pTX/RX}$ ) signals
L	LD signal

## Serial Data Input Timing

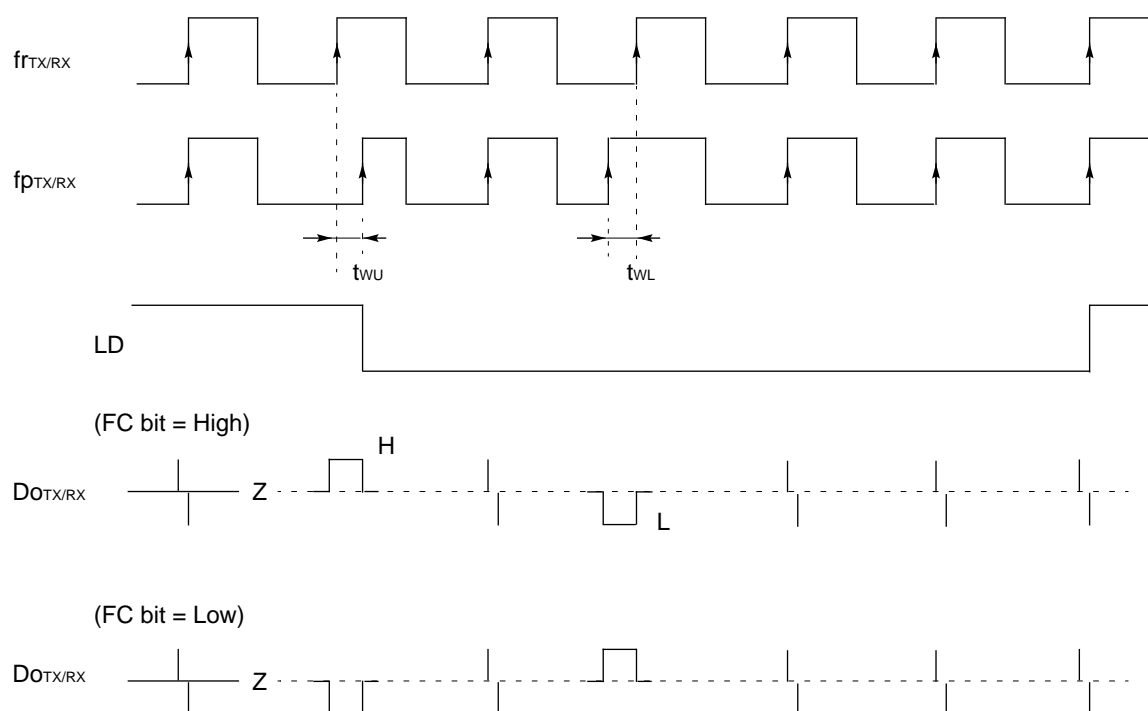

On rising edge of the clock, one bit of the data is transferred into the shift register.

Parameter	Min	Typ	Max	Unit
$t_1$	20	—	—	ns
$t_2$	20	—	—	ns
$t_3$	30	—	—	ns
$t_4$	20	—	—	ns

Parameter	Min	Typ	Max	Unit
$t_5$	30	—	—	ns
$t_6$	100	—	—	ns
$t_7$	100	—	—	ns

## ■ PHASE DETECTOR OUTPUT WAVEFORM

**LD Output Logic Table**

TX-PLL section	RX-PLL section	LD output
Locking state / Power saving state	Locking state / Power saving state	H
Locking state / Power saving state	Unlocking state	L
Unlocking state	Locking state / Power saving state	L
Unlocking state	Unlocking state	L

- Note:
- Phase error detection range =  $-2\pi$  to  $+2\pi$
  - Pulses on  $D_{oTX/RX}$  signals are output to prevent dead zone.
  - LD output becomes low when phase error is  $t_{wU}$  or more.
  - LD output becomes high when phase error is  $t_{wL}$  or less and continues to be so for three cycles or more.
  - $t_{wU}$  and  $t_{wL}$  depend on OSCin input frequency as follows.  
 $t_{wU} \geq 8/f_{osc}$ : i.e.  $t_{wU} \geq 625\text{ns}$  when  $f_{osc} = 12.8\text{ MHz}$   
 $t_{wL} \leq 16/f_{osc}$ : i.e.  $t_{wL} \leq 1250\text{ns}$  when  $f_{osc} = 12.8\text{ MHz}$

## ■ POWER SAVING MODE (Intermittent Mode Control Circuit)

Setting a PS<sub>TX(RX)</sub> pin to Low, TX-PLL (RX-PLL) enters into power saving mode resultant current consumption can be limited to 0.1  $\mu$ A (typ.). Setting PS pin to High, power saving mode is released so that the device works normally. In addition, the intermittent operation control circuit is included which helps smooth start up from stand by mode. In general, the power consumption can be saved by the intermittent operation that powering down or waking up the synthesizer. Such case, if the PLL is powered up uncontrolled, the resulting phase comparator output signal is unpredictable due to an undefined phase relation between reference frequency (fr) and comparison frequency (fp) and may in the worst case take longer time for lock up of the loop.

To prevent this, the intermittent operation control circuit enforces a limited error signal output of the phase detector during power up. Thus keeping the loop locked.

*PS pin must be set "L" at Power-ON.*

Allow 1  $\mu$ s after frequency stabilization on power-up for exiting the power saving mode (PS: L to H)

Serial data can be entered during the power saving mode.

During the power saving mode, the corresponding section except for indispensable circuit for the power saving function stops working, then current consumption is reduced to 10 $\mu$ A per one PLL section.

At that time, the Do and LD become the same state as when a loop is locking. That is, the Do becomes high impedance.

A VCO control voltage is naturally kept at the locking voltage which defined by a LPF's time constant. As a result of this, VCO's frequency is kept at the locking frequency.

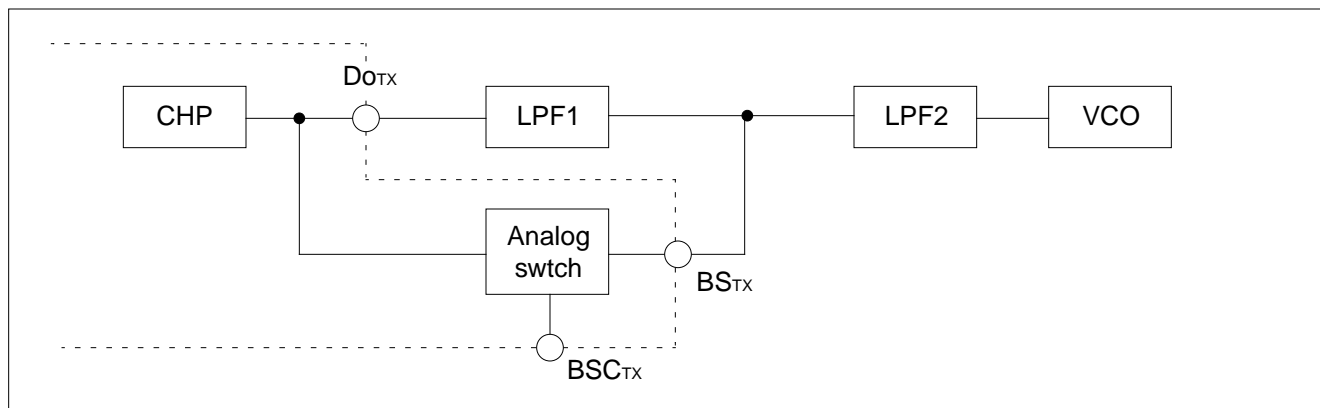

PS <sub>TX</sub>	PS <sub>RX</sub>	TX-PLL counters	RX-PLL counters	OSC input buffer
L	L	OFF	OFF	OFF
H	L	ON	OFF	ON
L	H	OFF	ON	ON
H	H	ON	ON	ON

### ■ ANALOG SWITCH (BSC<sub>TX</sub> Pin)

The analog switch is set on or off by the BSC<sub>TX</sub> input. When the switch is on, the output of the charge pump (Do<sub>TX</sub>) is output from the BS<sub>TX</sub> pin. (The pin goes to high impedance when the switch is off.)

Analog switch	BSC <sub>TX</sub>
ON	H
OFF	L

As in the example shown in the figure below, placing the analog switch midway through the LPF (LPF1 + LPF2) allows the LPF time constant to be reduced during PLL channel switching so as to speed up the lock up time.
