

## Octal inverting buffers with 3-state outputs

**HEF40240B  
buffers**

### DESCRIPTION

The HEF40240B is an octal inverting buffer with 3-state outputs. It features output stages with high current output capability suitable for driving highly capacitive loads.

The 3-state outputs are controlled by the output enable inputs  $\overline{EO}_A$  and  $\overline{EO}_B$ . A HIGH on  $\overline{EO}$  causes the outputs to assume a high impedance OFF-state. The device also features hysteresis on all inputs to improve noise immunity.

Schmitt-trigger action in the inputs makes the circuit highly tolerant to slower input rise and fall times.

The HEF40240B is pin and functionally compatible with the TTL '240' device.

## Notes

1. H = HIGH state (the more positive voltage)  
L = LOW state (the less positive voltage)  
X = state is immaterial  
Z = high impedance off state
